

João Dias

Design Engineer · Senior Frontend Engineer · Web Accessibility

Coimbra, Portugal | Portuguese & EU Citizen | Authorized to work across the EU without visa sponsorship

joaodias.me | github.com/JoaoTMDias | linkedin.com/in/joaotmdias

Professional summary

Design Engineer with more than 15 years of experience connecting interface design and frontend engineering. EU citizen based in Portugal with unrestricted right to work across the European Union (open to remote and relocation opportunities). I design with technical constraints in mind and build production interfaces with close attention to accessibility, semantics, interaction and detail. My work spans product engineering, design systems, developer tooling, automated accessibility testing and technical teaching.

Core skills

Web accessibility (WCAG and EAA) · Design engineering · Interface design · Design systems · React · TypeScript · JavaScript · Node.js · Astro · Vite · Playwright · Cypress · Testing Library · Web Components · Lit

Professional experience

Revolut — Frontend Engineer

Remote | January 2026–July 2026

- Introduced Playwright-based end-to-end testing for GEO applications, setting up the pipeline, initial test architecture and reusable patterns for critical user flows, reducing reliance on manual post-deployment validation.
- Built a shared GEO pattern library with Storybook to standardize recurring domain-specific UI patterns across applications, including reusable table abstractions, forms and data-presentation patterns.
- Developed Business Continuity Plans functionality within Service Catalogue, using MSW and Zod to enable frontend development against evolving API contracts before the backend was fully available.
- Delivered complex workflows involving multi-step forms, persistent state, modals and data visualization, later aligning mocked contracts with the production API using its Swagger specification.

- Took on increased frontend ownership shortly after joining, contributing to code reviews, technical decisions, onboarding another engineer and reducing accumulated UI/UX technical debt in collaboration with Design.

Feedzai — Advanced Frontend Engineer and Accessibility Advocate

Coimbra, Portugal | 2024–2026

- Led frontend work on Escudo, Feedzai's design system, covering component architecture, APIs, testing, documentation, releases and contribution workflows.
- Rebuilt legacy components while preserving backwards compatibility for existing products, including complex components such as Select, Dropdown and Table.
- Led the migration of Escudo from Webpack/CommonJS to Vite and ES Modules while maintaining a compatible CommonJS distribution for legacy consumers.
- Built internal tooling to understand design-system adoption and identify components and patterns still being duplicated across products.
- Worked on accessibility at the component and design-system level so fixes and improvements could be reused across multiple products.

Farfetch — Senior Software Engineer, Frontend

Porto, Portugal | 2023–2024

- Worked on CRHub, a Next.js and NestJS application connecting stores selling Farfetch products and supporting the customer purchase lifecycle from product selection through delivery.
- Set up the project's testing pipeline, including unit tests with Vitest and end-to-end testing with Playwright.
- Introduced component-level validation and accessibility testing where no equivalent checks had previously been in place.
- Built tooling to simplify adoption of the pattern library created specifically for CRHub.
- Acted as a bridge between the Farfetch team and external engineers working on the project, reviewing their output against Farfetch engineering and quality standards.

Feedzai — Senior Frontend Engineer and Accessibility Advocate

Coimbra, Portugal | 2019–2023

- Helped modernise Case Manager, a large fraud and financial-crime investigation application with a long-lived JavaScript and React codebase.
- Drove the incremental migration from JavaScript to TypeScript, restructuring large legacy components where necessary; roughly half of the frontend was migrated.
- Reworked the frontend testing strategy, moving from implementation-focused Enzyme tests towards Testing Library and replacing Selenium with Cypress.
- Helped reduce the end-to-end test pipeline from roughly four hours to around one hour, and later from about 45 minutes to 15 minutes through further pipeline improvements.

- Created internal tooling to combine Jest and Cypress coverage into a single report.
- Modernised parts of the Redux architecture, moving older patterns towards hooks and selector-based state access.
- Worked with UX on a major UI Kit overhaul, improving consistency, interaction patterns, contrast and shared component behaviour.
- Helped reduce recurring accessibility issues by moving accessibility concerns into shared components and engineering practices.
- Bootstrapped the frontend architecture for RiskOps Studio, a shared workspace integrating multiple Feedzai risk-management products.
- Introduced a micro-frontend architecture using Webpack Module Federation so product teams could integrate independently developed applications into a common shell.
- Worked on shared dependency management, including React and React Router, to reduce version conflicts and duplicated runtime dependencies.
- Explored an SDK for communication between micro-frontends and the Studio shell using stable contracts rather than direct access to shell internals.

ISEC — Invited Assistant Professor

Coimbra, Portugal | 2022–2023

- Taught interface and frontend development topics as an invited assistant professor.

WIT Software — UI and Graphic Designer, Frontend Developer

Coimbra, Portugal | 2013–2019

Load Interactive — Web, Mobile and Graphic Designer

Aveiro, Portugal | 2012–2013

joaodias.me — Freelance Web and Graphic Designer

Figueira da Foz, Portugal | 2008–2012

Selected projects

A11y Page Checker

Local-first accessibility auditing platform combining Playwright and axe-core with a typed API, CLI, web dashboard, HTML reports and an MCP server. Designed scan contracts, failure isolation and multiple interfaces for repeatable audits.

React A11y Tools

Open-source React library that packages recurring accessibility patterns such as route announcements, roving tabindex, focus management and heading-order utilities for reuse across applications.

Raider

Music-discovery application using Last.fm relationships to explore artists, related acts and top tracks through an interactive, accessible interface built with Next.js, React and Visx.

WinPicker

Windows desktop colour tool that helps designers and developers compare foreground and background colours and inspect WCAG contrast results using React, Electron and Fluent UI.

Additional activity

Radio host at Rádio Universidade de Coimbra. Open-source maintainer and accessibility advocate. Former invited assistant professor teaching interface and frontend topics.
